# METRO Straight Drop Awning

*Metro Straight Drop with optional cassette and steel rod side guides*

The Metro series represents the traditional Vertical Awning. It can be installed on the face or within the reveal. With the addition of an elegant rounded elliptical shaped extruded aluminium cassette head box to conceal and protect the fabric, the cassette is held by the aluminium guide rails and consequently self-supporting. Otherwise, it answers the same requirements as a fabric tensioned system. The tension of the fabric being held taught by the weight of the bottom rail. Additional weight in the bottom rail of the Metro is possible. Operation of the Metro awning can either be by the use of a Crank driven gearbox or, better, with a remote controlled electric motor concealed discreetly within the fabric tube. A further option instead of the extruded side guides is the use of stainless steel rods or cables placed either side, so that the awning slides smoothly up and down, any of these options means that the awning can safely be left at an intermediate point whilst the wind blows. The addition of a wind sensor is recommended. Types of fabrics that could be used are either a Sunscreen mesh to retain your views or traditional acrylic translucent fabrics. Powder coating of the aluminium sections is also possible to blend in with the facade.
